CSC 502 – Project
*(Forming a group is recommended. Groups of up to **4** students are allowed. All group members are expected to contribute meaningfully to the project.)*

This is an exploratory research project focused on studying, explaining, and implementing one or more important research papers related to a big data problem that interests you. You should submit a one-paragraph description of your project, along with the names and student IDs of all group members, no later than **March 19**.

Your project can consist of the following three phases:

- **Paper understanding and explanation:** A clear explanation of the problem studied and the algorithm(s) proposed in the paper(s), possibly supported by a small real or toy dataset.
- **Implementation:** Implementation of the main algorithm(s) described in the paper(s), or a well-justified subset of them.
- **Experimentation:** Experimental evaluation of the algorithm(s) using real datasets.

At least one of these phases must be non-trivial.

You should submit a written report describing your work. The expected length of the report is **5–10 pages** in double column IEEE format or **12-15 pages** in LNCS format.

https://www.overleaf.com/latex/templates/springer-lecture-notes-in-computer-science/kzwwpvhwnvfj

Each group will present their project in class.

A set of papers is provided for you to choose from if you wish. You are also free to select paper(s) related to your own research interests, including papers not included in the provided set.
